

## DID YOU KNOW...?

Issue 3

**...Most glass surface treatments applied as liquids are highly flammable, and as a result, are classified as 'hazardous'.**

Therefore strict and costly precautions must be followed during transport, storage, application and disposal. Suppliers often fail to point out these precautions with potentially serious consequences, including damage to employees and premises as well as severe penalties for breaching health and safety regulations.

In comparison, Ritec 'ClearShield' durable glass surface protection is not classified as hazardous under health and safety regulations. It is non-flammable.
